

The registered nurse is doing her work on a laptop.

She feels a vibration from her phone in her pocket.

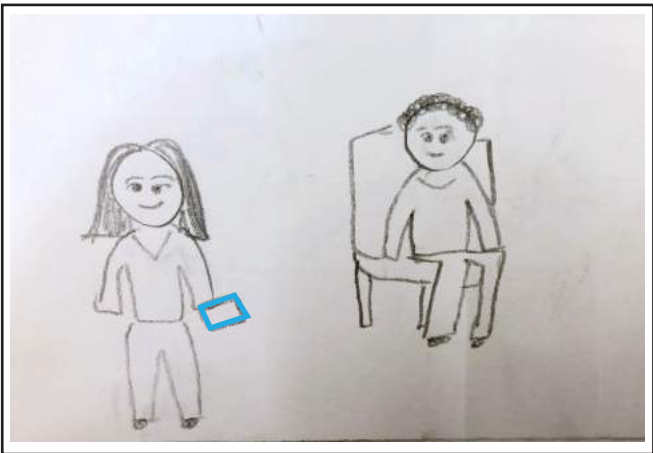

She checks her phone and sees that she has a notification indicating that she has a new priority message from Dr. Grey.

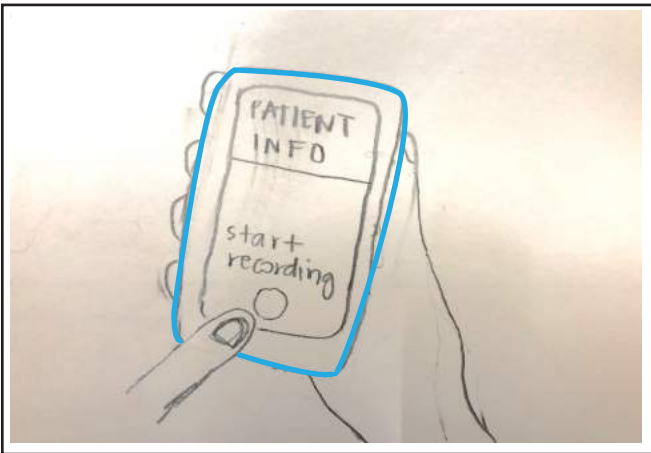

She opens the application to see all of her messages, separated by priority and non-priority.

Since the application says the message from Dr. Grey is urgent, she immediately responds to the message.

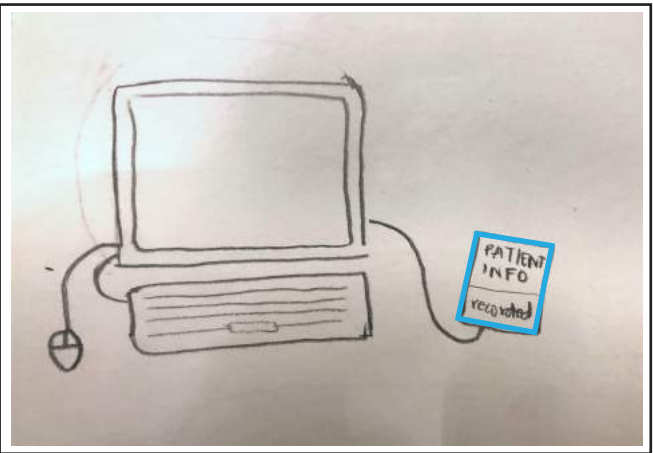

The registered nurse meets with a new patient.

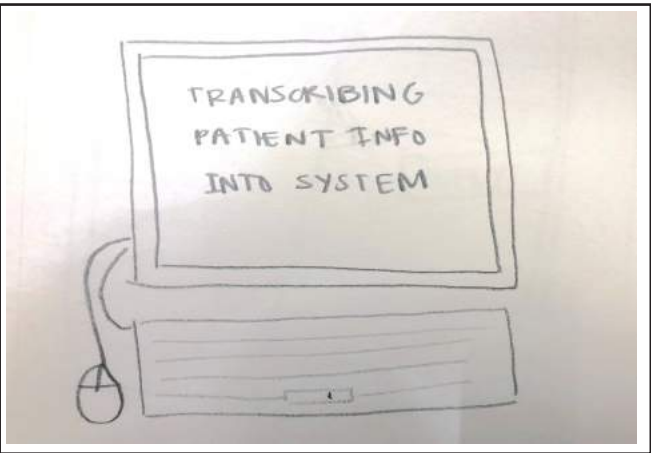

She takes out her phone and presses the start recording button.

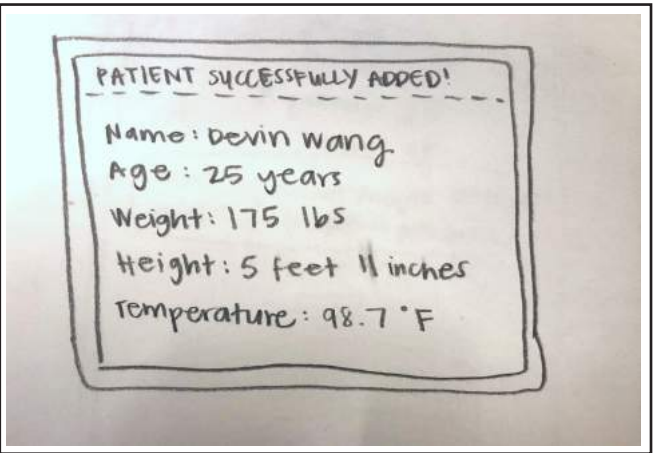

The patient begins to explain his personal information, while the device is recording.

After the appointment, the registered nurse plugs her phone into the hospital's desktop computer.

The phone syncs with the desktop computer, and a software on the computer begins to transcribe the patient's information from the recording.

The new patient's information is easily added to the hospital's database system, without the use of any paper forms.
